Image Streamer Overview

HPE Synergy Image Streamer is an appliance used to host, configure and serve operating systems to HPE Synergy compute modules. This appliance provides a truly stateless experience for the HPE Synergy compute modules. The HPE Synergy compute modules boot and run out of the HPE Synergy Image Streamer hosted OS volume.

Stateless servers are physical servers without a local boot disk. To achieve statelessness, the physical state and deployed software state of the compute modules are maintained separately. Physical state contains the firmware configuration, network configuration, shared data/storage configuration, boot settings and ILO configuration. With HPE Synergy Image Streamer, the deployed software state will also be managed outside of the compute module using server profiles.

The OS volume (boot volume hosted on the HPE Synergy Image Streamer appliance) contains the Golden Image (a combination of bootable operating system, applications and IO driver versions) and personality details (hostname, IP configuration and other OS based custom setting).

An HPE Composer domain can have multiple HPE Synergy Image Streamer appliances. Each appliance pair can serve all the compute modules in one logical enclosure. For a pair of appliances, the Artifacts management and OS deployment functions are served by an Active-Standby Cluster, whereas the OS volume storage is served by an Active-Active storage cluster.

Image Streamer Building Blocks

HPE Synergy Image Streamer appliance uses following artifacts for development.

Golden Image

A block-by-block copy of the Operating System Volume (combination of Bootable OS, applications and I/O drivers).

Plan Script

Guest fish script used to accomplish deployment & capture of an operating system for the HPE Synergy compute modules. A Plan Script can be of type General, Deploy & Capture. It personalizes / generalizes the Operating System and contains Custom attributes that can be configured through a Build Plan / Deployment Plan / Server Profile.

Build Plans

Set of Plan Scripts ordered as steps used to add, modify, or remove the configuration of an OS volume during the deployment and capture process.

Deployment Plans

A combination of Golden Image and OS Build Plan that serves as an input to a server profile (used for deployment of operating system for Synergy compute modules).

Artifacts Bundles

A bundle allows all the artifacts to be packaged into a single archive file. It can then be moved to other appliances too. This format is used by Hewlett Packard Enterprise to release the artifacts for supported Operating Environments.

Sep 2018

Coverage

This technical document covers HPE Synergy Image Streamer Artifact Bundle for Microsoft Windows Server. This includes artifacts that can be used to capture, deploy and personalize Microsoft Windows Server 2016 or Microsoft Hyper-V Server 2016 Operating Systems.

With this guide, we will be covering

- Artifacts creation, download/upload & extraction.
- Working with Artifacts.
- Upload Artifacts / Modifying Artifacts.
- Upload Golden Image.
- Create Deployment Plan.
- OS Deployment using Server Profile.
- Capture Functionality.

Initial Setup

We assume that the users already have a running HPE Synergy Image Streamer setup.

- All the components in HPE Synergy frames are running qualified firmware as per the GARFS/SERFS/TERFS recipe
- With supported Build versions of HPE OneView and HPE Synergy Image Streamer.
- With valid network configuration.
- HPE OneView and HPE Synergy Image Streamer appliances are up and running.
- OS Deployment Server is created.
- Logical Interconnect Group (LIG), Enclosure Group (EG) and Logical Enclosure (LE) are created with HPE Synergy Image Streamer intent.

Working with Artifacts

Login into HPE Synergy Image Streamer

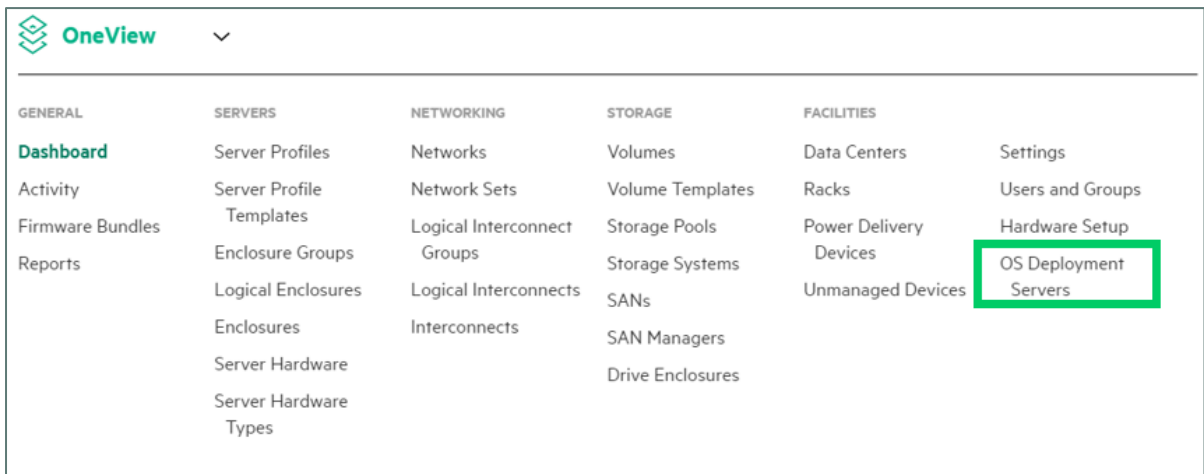

From HPE OneView Main Menu, go to OS Deployment Servers.

© Copyright 2018 Hewlett Packard Enterprise Development LP. The information contained herein is subject to change without notice. The only warranties for Hewlett Packard Enterprise products and services are set forth in the express warranty statements accompanying such products and services. Nothing herein should be construed as constituting an additional warranty. Hewlett Packard Enterprise shall not be liable for technical or editorial errors or omissions contained herein.

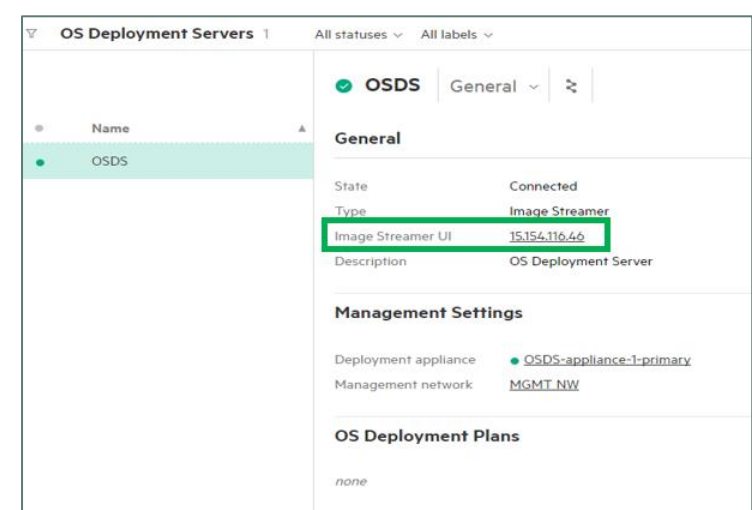

This document contains confidential and/or legally privileged information. It is intended for Hewlett Packard Enterprise and Channel Partner Internal Use only. If you are not an intended recipient as identified on the front cover of this document, you are strictly prohibited from reviewing, redistributing, disseminating, or in any other way using or relying on the contents of this document.

Sep 2018

Click on Image Streamer UI to access HPE Synergy Image Streamer.

OS Deployment Server (OSDS) state must be connected, otherwise, the OSDS will not be created.

User roles for Image Streamer

The following user roles exist for configuring and accessing HPE Synergy Image Streamer using HPE OneView:

Infrastructure Administrator

This user will have complete Administrative privileges to configure HPE Image Streamer and HPE Synergy Composer (OV).

Server Administrator

This user will perform server provisioning and OS deployment from the Server Profile in HPE OneView.

© Copyright 2018 Hewlett Packard Enterprise Development LP. The information contained herein is subject to change without notice. The only warranties for Hewlett Packard Enterprise products and services are set forth in the express warranty statements accompanying such products and services. Nothing herein should be construed as constituting an additional warranty. Hewlett Packard Enterprise shall not be liable for technical or editorial errors or omissions contained herein.

This document contains confidential and/or legally privileged information. It is intended for Hewlett Packard Enterprise and Channel Partner Internal Use only. If you are not an intended recipient as identified on the front cover of this document, you are strictly prohibited from reviewing, redistributing, disseminating, or in any other way using or relying on the contents of this document.

Sep 2018

Software Administrator

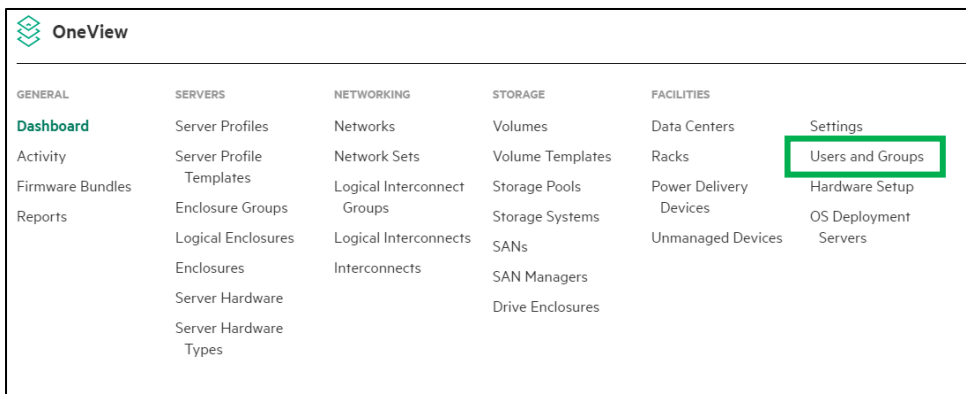

This user can perform following actions.

- Create and manage Artifacts such as Plan Scripts, Build Plans, Deployment Plans and Golden Image.
- Manage and load Artifacts Bundles.
- Capture Golden images from OS volumes.
- Set default configuration that server administrator needs for Server provisioning/deployment.

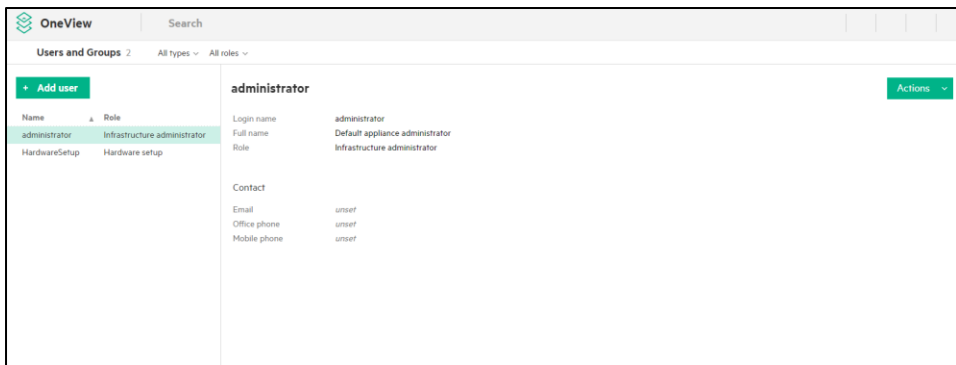

Note
Software Administrator cannot create the Server profile. And Server Administrator cannot create/manage artifacts. Please note that these users will be created in HPE OneView.

Create HPE Synergy Image Streamer Users in HPE OneView:

Login to HPE OneView.
Click Users and Groups from main menu.

To create user, click Add user and enter the following details.

Sep 2018

Click “OS Deployment Servers” from the HPE OneView main menu and access the Image streamer UI (see below)

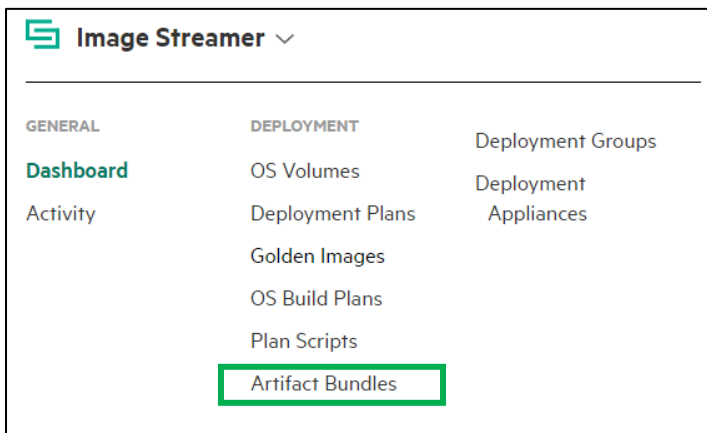

On the HPE Synergy Image Streamer main menu (which will open as another tab), Click **Plan Scripts**.
Note: The Server Administrator does not have the access to create/manage Artifacts.

Artifact Bundle Creation/Download/Upload

You are currently logged in as “**Server Administrator**” who doesn’t have the privilege to manipulate artifacts. Log into HPE OneView as the “**Software Administrator**” user you created in the previous lab, and launch the HPE Synergy Image Streamer UI again.

From the HPE Synergy Image Streamer menu, Click on the Artifact Bundle.

In your browser review the latest Windows Artifacts bundle from [Windows Artifact Bundle - Github](#). Download the latest bundle to your desktop.

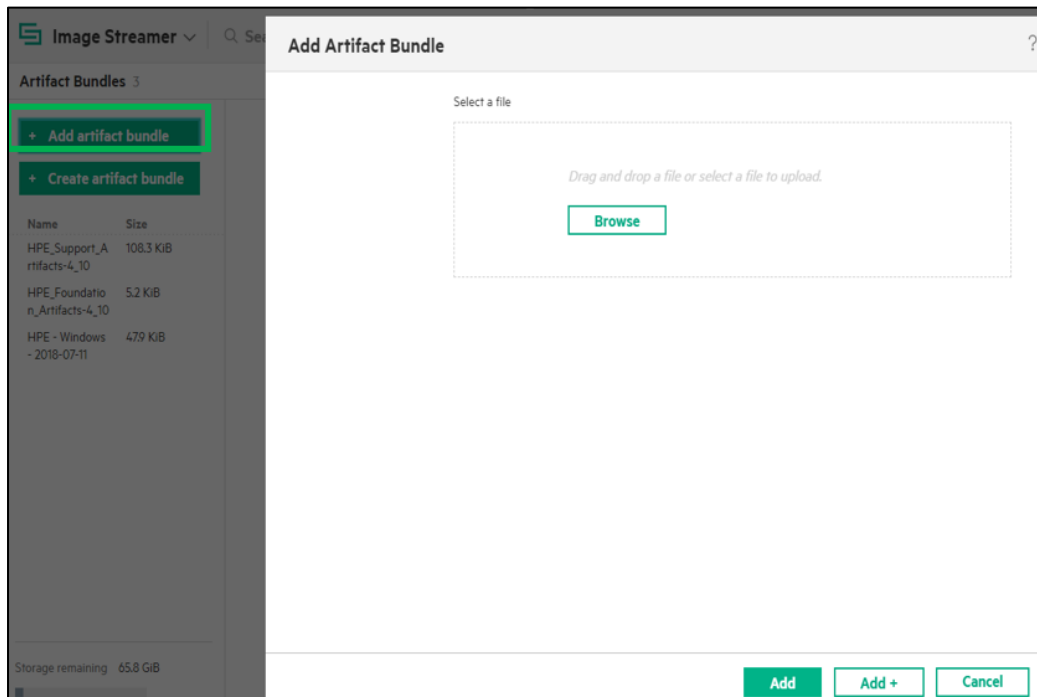

© Copyright 2018 Hewlett Packard Enterprise Development LP. The information contained herein is subject to change without notice. The only warranties for Hewlett Packard Enterprise products and services are set forth in the express warranty statements accompanying such products and services. Nothing herein should be construed as constituting an additional warranty. Hewlett Packard Enterprise shall not be liable for technical or editorial errors or omissions contained herein.

This document contains confidential and/or legally privileged information. It is intended for Hewlett Packard Enterprise and Channel Partner Internal Use only. If you are not an intended recipient as identified on the front cover of this document, you are strictly prohibited from reviewing, redistributing, disseminating, or in any other way using or relying on the contents of this document.

Sep 2018

Rename the Artifact Bundle in the folder you saved it to in order to include your team name at the end –e.g HPE - Windows - 2018-07-11.zip to HPE - Windows - 2018-07-11.zip_TeamX. This will allow you to import the artifacts.

Click on “Add Artifacts Bundle”.

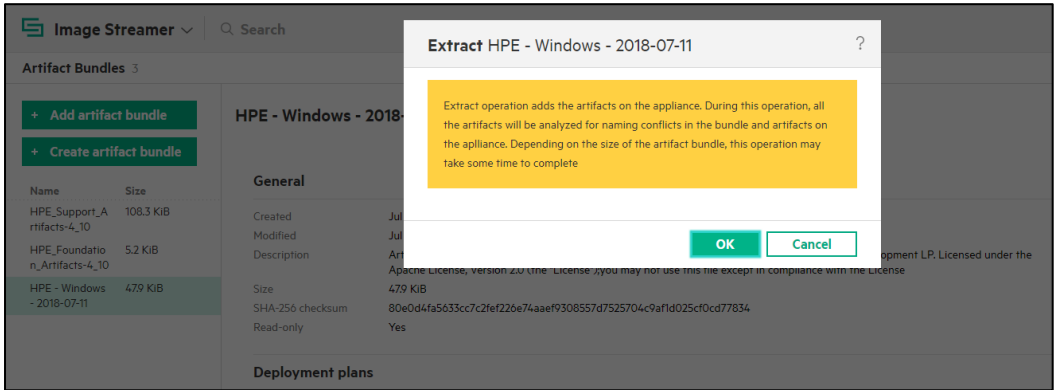

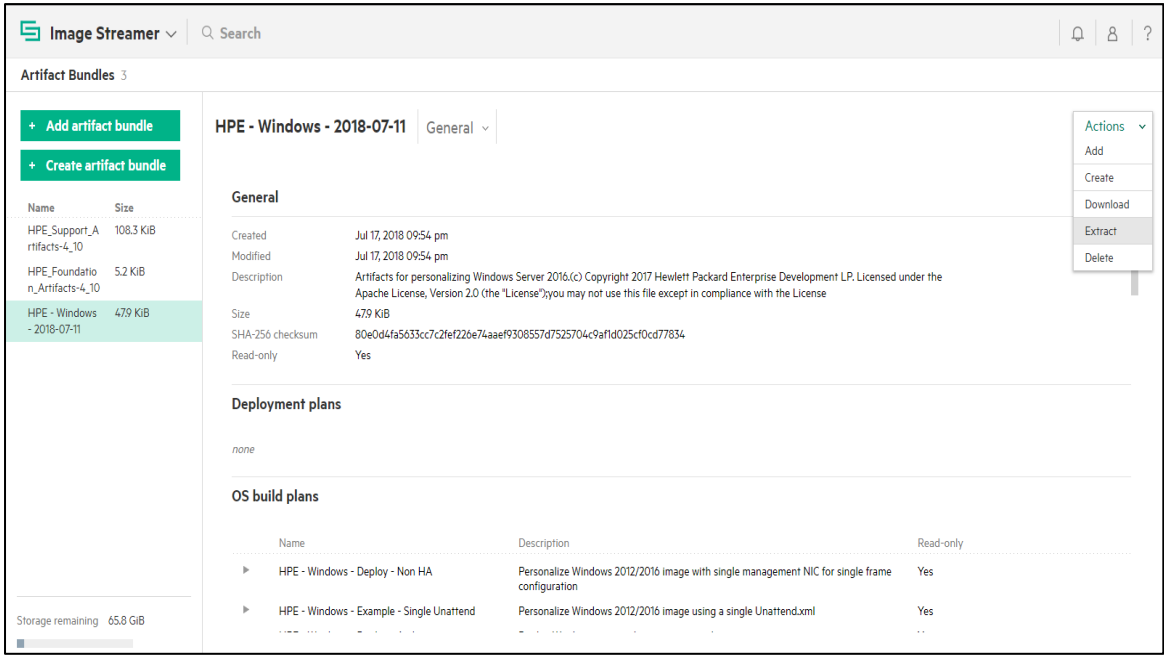

Highlight the listed Artifacts bundle that was just added on the left hand side pane. Go to Actions menu and “**Extract**” the Artifacts bundle. Extraction of bundle will populate the artifacts from the bundle on the UI.

© Copyright 2018 Hewlett Packard Enterprise Development LP. The information contained herein is subject to change without notice. The only warranties for Hewlett Packard Enterprise products and services are set forth in the express warranty statements accompanying such products and services. Nothing herein should be construed as constituting an additional warranty. Hewlett Packard Enterprise shall not be liable for technical or editorial errors or omissions contained herein.

This document contains confidential and/or legally privileged information. It is intended for Hewlett Packard Enterprise and Channel Partner Internal Use only. If you are not an intended recipient as identified on the front cover of this document, you are strictly prohibited from reviewing, redistributing, disseminating, or in any other way using or relying on the contents of this document.

Sep 2018

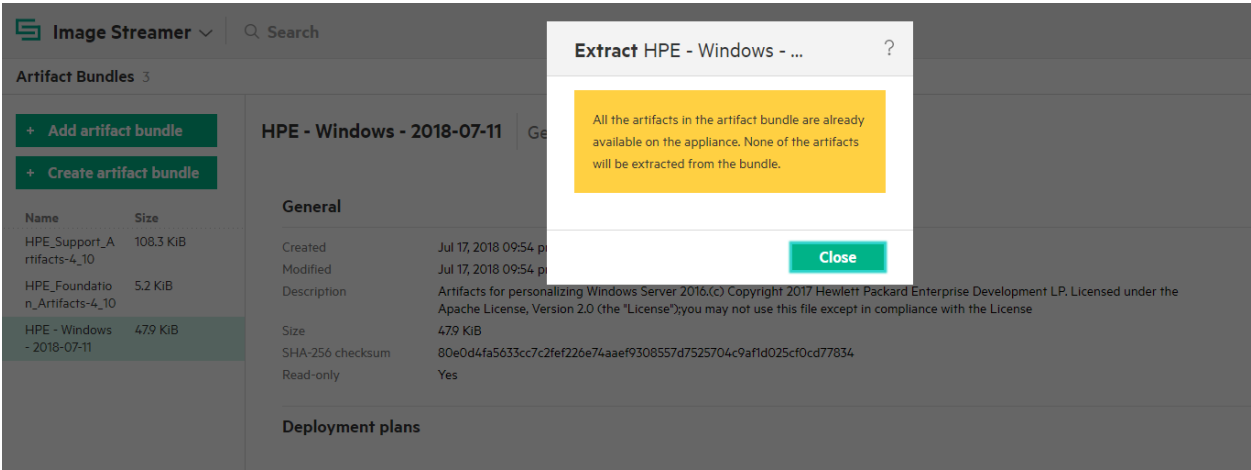

Please note, you will receive the following notification that the bundle already exists, this is because other teams would have pre-populated the HPE Synergy Image Streamer with the scripts.

© Copyright 2018 Hewlett Packard Enterprise Development LP. The information contained herein is subject to change without notice. The only warranties for Hewlett Packard Enterprise products and services are set forth in the express warranty statements accompanying such products and services. Nothing herein should be construed as constituting an additional warranty. Hewlett Packard Enterprise shall not be liable for technical or editorial errors or omissions contained herein.

This document contains confidential and/or legally privileged information. It is intended for Hewlett Packard Enterprise and Channel Partner Internal Use only. If you are not an intended recipient as identified on the front cover of this document, you are strictly prohibited from reviewing, redistributing, disseminating, or in any other way using or relying on the contents of this document.

Note
With Extraction of Artifact Bundle, all the Plan Scripts, Build Plans and their association will get populated in HPE Synergy Image Streamer. The artifacts will be read only (in case you want to change, you need to edit the Plan Script, copy the contents and create new Plan Script (with different name). And since there is association between the Plan Scripts and Build Plans, you will need to copy the Build Plan to a new name and then add new Plan Scripts as required.

Using this procedure, multiple users can utilize the same bundle (and changes made by them would need new artifacts creation and users do not run into each other's work).

Working with Artifacts

Plan Script: This type of script can be General, Deploy & Capture, Script personalizes / generalizes the Operating System / Hypervisor. Custom attributes can be configured through Build Plan / Deployment Plan / Server Profile.

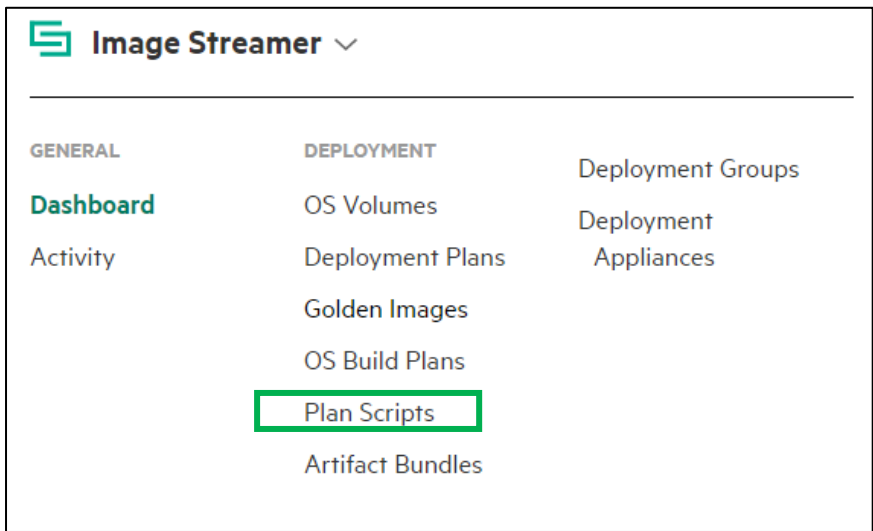

© Copyright 2018 Hewlett Packard Enterprise Development LP. The information contained herein is subject to change without notice. Sep 2018

Create (instead of copy) a “personalize” script and modify the text below.

Name : Personalize Script
Description : “Script for Personalize Operation”
Type : Deploy
Contents : Add Personalize script contents below in the contents section.
Edit the Bay number to be your bay number (seen twice below)

Sample Personalize script:

```
# Default value: @TimeZone:GMT Standard Time@  
  
# List of Time zones: https://technet.microsoft.com/en-us/library/cc749073(v=ws.10).aspx  
  
-mkdir-p /ISdeploy/Unattend/specialize/Microsoft-Windows-Shell-Setup  
upload -<<END_TIMEZONE /ISdeploy/Unattend/specialize/Microsoft-Windows-Shell-Setup/TimeZone.xml  
<TimeZone>@TimeZone@</TimeZone>  
END_TIMEZONE
```

The screenshot shows a 'Create Plan Script' dialog box with a 'General' tab. The 'Name' field contains 'Sample Plan Script Timezone'. The 'Description' field contains 'Personification of Timezone'. The 'Type' dropdown is set to 'Deploy'. The 'Contents' text area contains the following script code:

```
-mkdir-p /ISdeploy/Unattend/specialize/Microsoft-Windows-Shell-Setup  
upload -<<END_TIMEZONE /ISdeploy/Unattend/specialize/Microsoft-Windows-Shell-Setup/TimeZone.xml  
<TimeZone>@TimeZone@</TimeZone>  
END_TIMEZONE
```

At the bottom of the dialog, there is a status bar that says 'Changed: Contents' and three buttons: 'Create', 'Create +', and 'Cancel'.

Sep 2018

Press **“Create”** to create the personalize script.
All 3 Plan Scripts (Mount, Unmount and Personalize) have now been created.

Note
The custom attributes are derived from the Personalize Script and will appear when you use the Plan Script in Build Plan or Deployment Plan or Server profile.

OS Build Plan: This type of script can be Deploy and Capture, or a Build plan associated with one or more Plan Scripts. Below Build Plans are bundled inside the extracted Artifact Bundle.

1. Build Plan: HPE - Windows - Capture - As-Is

This Build Plan can be used to create a Golden Image from a Windows volume without performing any modifications on the volume contents.

2. Build Plan: HPE - Windows - Deploy - As-Is

© Copyright 2018 Hewlett Packard Enterprise Development LP. The information contained herein is subject to change without notice. The only warranties for Hewlett Packard Enterprise products and services are set forth in the express warranty statements accompanying such products and services. Nothing herein should be construed as constituting an additional warranty. Hewlett Packard Enterprise shall not be liable for technical or editorial errors or omissions contained herein.

This document contains confidential and/or legally privileged information. It is intended for Hewlett Packard Enterprise and Channel Partner Internal Use only. If you are not an intended recipient as identified on the front cover of this document, you are strictly prohibited from reviewing, redistributing, disseminating, or in any other way using or relying on the contents of this document.

This Build Plan can be used to deploy a Windows Golden Image without any personalization. It does not perform any modifications on the volume contents.

3. Build Plan: HPE - Windows - Deploy - HA

This Build Plan can be used to deploy a Windows Golden Image with management NICs teamed for high-availability.

Steps: Plan Script Names	Attributes
HPE - Windows - Mount	
HPE - Windows - Initialize	
HPE - Windows - HyperV - Enable	
HPE - Windows - iSCSI Multi-path IO	
HPE - Windows - Locale	DisplayLanguage (Option) Keyboard Layout (Option)
HPE - Windows - Network - HA Configuration	ManagementNIC1 (NIC) ManagementNIC2 (NIC)
HPE - Windows - Network - Proxy	ProxyServerAddress (String) ProxyServerPort (Number) ProxyServerSkipForAddresses (String)
HPE - Windows - Power Plan	PowerPlan (Option)

4. Build Plan: HPE - Windows - Deploy - Non HA

This Build Plan can be used to deploy a Windows Golden Image with management NIC without high-availability.

Steps: Plan Script Names	Attributes
HPE - Windows - Mount	
HPE - Windows - Initialize	
HPE - Windows - HyperV - Enable	
HPE - Windows - Locale	DisplayLanguage (Option) Keyboard Layout (Option)
HPE - Windows - Network - Non HA Configuration	ManagementNIC
HPE - Windows - Network - Proxy	ProxyServerAddress (String) ProxyServerPort (Number) ProxyServerSkipForAddresses (String)
HPE - Windows - Power Plan	PowerPlan (Option)
HPE - Windows - Remote Desktop	RemoteDesktop (Option)
HPE - Windows - Time Zone	TimeZone (Option)
HPE - Windows - User - Add - 1	User1DisplayName (String) User1Name (String) User1Password (Password)
HPE - Windows - User - Administrator	Password (Password)
HPE - Windows - Unattend - Save	
HPE - Windows - Unmount	

5. Build Plan: HPE - Windows - Example - Deploy

This Build Plan uses all Plan Scripts from the artifact bundle and demonstrates how to use the example Plan Scripts for personalization. This can be used as a reference to create custom Windows artifacts.

HPE - Windows - User - Auto Logon	AutoLogonUsername AutoLogonPassword
HPE - Windows - Unattend - Save	
HPE - Windows - Unattend - Debug	
HPE - Windows - Unmount	

6. Build Plan: HPE - Windows - Example - Single Unattend

This Build Plan is an example of personalizing Windows using a single Unattend.xml file

Steps: Plan Script Names	Attributes
HPE - Windows - Mount	
HPE - Windows - Example - Single Unattend	UserDisplayName (String) UserName (String) UserPassword (String)
HPE - Windows - Unmount	

7. Plan Scripts

7.1 HPE - Windows - Mount

This Plan Script lists all mount partitions and mounts the FAT32 partition (S: drive) of the image. It also creates directories used by other Plan Scripts for personalization.

7.2 HPE - Windows - Initialize

Creates initial (default) configuration for Unattend.xml.

7.3 HPE - Windows - Hostname

Sets the Computer Name (Hostname)

Attributes:

Hostname (String)

© Copyright 2018 Hewlett Packard Enterprise Development LP. The information contained herein is subject to change without notice. The only warranties for Hewlett Packard Enterprise products and services are set forth in the express warranty statements accompanying such products and services. Nothing herein should be construed as constituting an additional warranty. Hewlett Packard Enterprise shall not be liable for technical or editorial errors or omissions contained herein.

Sep 2018

Computer Name (Hostname) to set. Can be maximum 15 characters in length.
To automatically generate a computer name, specify * (asterisk).

7.4 HPE - Windows - Hyper - V - Enable

Enables Hyper-V if it is not already enabled. Enabling Hyper-V requires reboot.

7.5 HPE - Windows - iSCSI Multi-path IO

Enables multi-path I/O for iSCSI

7.6 HPE - Windows - Locale

Sets the display language and keyboard layout

Attributes:

DisplayLanguage (Option): The display language to set

KeyboardLayout (Option): The keyboard layout to set

7.7 HPE - Windows - Network – Domain

Joins the domain with credentials

Attributes:

DomainAccount (String) Username for joining domain.

DomainName (FQDN) Domain to join.

DomainPassword (Password) Password for the specified DomainAccount username for joining domain.

7.8 HPE - Windows - Network - HA Configuration

Configures the management network with high-availability

Attributes:

ManagementNIC1 (NIC)

This attribute is of type NIC and has the following four sub-attributes:

ManagementNIC1.dns1

ManagementNIC1.dns2

ManagementNIC1.gateway

ManagementNIC1.ipaddress

ManagementNIC1.mac

ManagementNIC1.netmask

These sub-attributes are used to configure network settings.

ManagementNIC2 (NIC)

This attribute is of type NIC and has the following four sub-attributes:

ManagementNIC2.dns1

ManagementNIC2.dns2

ManagementNIC2.gateway

ManagementNIC2.ipaddress

ManagementNIC2.mac

ManagementNIC2.netmask

These sub-attributes are used to configure network settings.

7.9 HPE - Windows - Network - Non-HA Configuration

Configures the management network without high-availability.

Attributes:

ManagementNIC (NIC)

This attribute is of type NIC and has the following four sub-attributes:

ManagementNIC.dns1

ManagementNIC.dns2

ManagementNIC.gateway

ManagementNIC.ipaddress

ManagementNIC.mac

ManagementNIC.netmask

Sep 2018

These sub-attributes are used to configure network settings.

7.10 HPE - Windows - Network - Proxy

Configures the proxy server address and port. Also sets the list of addresses that bypass the proxy server.

Attributes:

ProxyServerAddress (String): The address of the proxy server, without http(s)://

ProxyServerPort (Number): The port of the proxy server. For example: 8080

ProxyServerSkipForAddresses (String)

List of hostnames or IP addresses that bypass the proxy server.

Multiple addresses must be separated by semicolons (;).

Include string <local> to bypass the proxy server for all intranet addresses.

7.11 HPE - Windows - OEM Information

Sets the OEM manufacturer name and model of the server

Attributes:

OEMManufacturerName (String)

The OEM manufacturer name. For example: Hewlett Packard Enterprise

OEMModelName (String)

The server model. For example: Synergy 480 Gen9

7.12 HPE - Windows - Owner Info

Sets the computer owner's name and organization.

Attributes:

OrganizationName (String): Computer owner's organization

OwnerName (String): Computer owner's name

7.13 HPE - Windows - Pagefile - Custom Size

Sets the minimum and maximum pagefile size.

Attributes:

PagefileMaximumSizeMB (Number)

Maximum size of the pagefile.

PagefileMinimumSizeMB (Number)

Minimum size of the pagefile.

7.14 HPE - Windows - Pagefile - Disable

Disables the pagefile.

This script must not be used with "HPE - Windows - Pagefile - Custom Size" Plan Script.

7.15 HPE - Windows - Power Plan

Sets the power plan to "Balanced", "High Performance" or "Power Saver"

Attributes:

PowerPlan (Option): Power plan to use

7.16 HPE - Windows - Product Key

Sets the Windows product key

Attributes:

WindowsProductKey (String): The Windows product key.

7.17 HPE - Windows - Remote Desktop

Enables or disables remote desktop

Attributes:

© Copyright 2018 Hewlett Packard Enterprise Development LP. The information contained herein is subject to change without notice. The only warranties for Hewlett Packard Enterprise products and services are set forth in the express warranty statements accompanying such products and services. Nothing herein should be construed as constituting an additional warranty. Hewlett Packard Enterprise shall not be liable for technical or editorial errors or omissions contained herein.

If you are not an intended recipient as identified on the front cover of this document, you are strictly prohibited from reviewing, redistributing, disseminating, or in any other way using or relying on the contents of this document.

Sep 2018

RemoteDesktop (Option)
Option to allow or disallow remote desktop.

7.18 HPE - Windows - Time Zone

Sets the time zone.

Attributes:

TimeZone (Option): Option to specify time zone.

7.19 HPE - Windows - Unattend – Debug

Validates Unattend.xml's XML syntax and logs the contents in deployment log.

This script logs the passwords in plain text, so it should be used only for debugging purpose during Windows artifact development.

7.20 HPE - Windows - Unattend - Save

Generates a single Unattend.xml file from the fragments created by other Plan Scripts.

Should be placed just above the unmount script in the OS Build Plan steps.

7.21 HPE - Windows - Unmount

Generates the SetupComplete.cmd file which executes scripts created by other Plan Scripts.

Should be the last step in the OS Build Plan. Unmounts the FAT32 partition.

7.22 HPE - Windows - User - Add - 1

Creates an additional administrator user account.

Attributes:

User1DisplayName (String): User's display name.

User1Name (String): Username of the account.

User1Password (Password): Account password.

7.23 HPE - Windows - User - Add - 2

Creates an additional administrator user account.

Attributes:

User2DisplayName (String): User's display name.

User2Name (String): Username of the account.

User2Password (Password): Account password.

7.24 HPE - Windows - User - Administrator

Configures the "Administrator" user account.

Attributes:

Password (Password): The "Administrator" user's password.

7.25 HPE - Windows - User - Auto Logon

Sets the username and password for automatic logon at startup.

Attributes:

AutoLogonPassword (Password)

The password of the user with which to automatically logon.

AutoLogonUsername (String)

Username with which to automatically logon.

7.26 HPE - Windows - Example - Commands in Unattend

Example of running commands/scripts from Unattend.xml

© Copyright 2018 Hewlett Packard Enterprise Development LP. The information contained herein is subject to change without notice. Sep 2018

- 7.27 HPE - Windows - Example - First Logon Commands
Example of running commands the first time a user logs in
- 7.28 HPE - Windows - Example - Logon Commands
Example of running commands every time a user logs in
- 7.29 HPE - Windows - Example - PowerShell
Example of running a PowerShell script during Windows deployment
- 7.30 HPE - Windows - Example - Registry Edit
Example of modifying the Windows registry during deployment
- 7.31 HPE - Windows - Example - Registry Edit with .reg
Example of modifying the Windows registry during deployment using a .reg file
- 7.32 HPE - Windows - Example - Single Unattend
Example of personalizing windows by directly creating Unattend.xml with a single Plan Script.
It creates a user account as an example.
Attributes:
 - UserDisplayName (String): User's display name.
 - UserName (String): Username of the account.
 - UserPassword (Password): Account password.

Developing Windows Artifacts

New Plan Scripts should follow the following method/conventions for personalization that are used by the existing Plan Scripts.

Personalization method

The Plan Scripts provided in this artifact bundle use two methods of personalization:

- Unattend.xml. This is an answer file that stores the custom settings that are applied during Windows setup.
- SetupComplete.cmd script. This is a script where commands can be added to run at the end of Windows setup.

The Plan Scripts either generate parts of Unattend.xml or generate scripts that are invoked from SetupComplete.cmd.

Directory conventions

- /ISdeploy/SetupComplete Scripts created in this directory will be executed through SetupComplete.cmd in alphabetical order (more details below)
- /ISdeploy/Unattend Unattend.xml will be generated based on files and directories in this location (more details below)
- /ISdeploy/Scripts Scripts executed by Unattend.xml or other scripts are created here
- /ISdeploy/Files Files used by any scripts are created here
- /ISdeploy/Temp Temporary files and scripts created during personalization are stored at this location. These are deleted after personalization is completed

Sep 2018

Unattend.xml conventions

→Temporary directory (TMPDIR) used by "HPE - Windows - Unattend - Save" is /ISdeploy/Unattend/"

→HPE - Windows - Unattend - Save" script generates the entire Unattend.xml based on the parts generated by other scripts. This script must be added just before the "HPE - Windows - Unattend - Debug" (if included) and "HPE - Windows - Unmount" steps in OS Build Plan.

If a pass is to be included in Unattend.xml, TMPDIR/pass directory should exist.

For example: For specialize and oobeSystem passes, "/ISdeploy/Unattend/specialize" and "/ISdeploy/Unattend/oobeSystem" directories must be created by a Plan Script.

If a component is to be included, TMPDIR/pass/component directory should exist.

For example: /ISdeploy/Unattend/specialize/Microsoft-Windows-Shell-Setup

→If TMPDIR/pass/component.xml file exists, it is considered as the contents of start tag of that component. If it doesn't exist, start tag is automatically generated.

→TMPDIR/pass/component directory can contain directories or files. Directories are used for nested elements inside components. For example: oobeSystem > Microsoft-Windows-Shell-Setup > UserAccounts > LocalAccounts

→Contents of all files (preferably created having .xml extension) are added inside the component XML. This is done in alphabetical order of filenames (as listed by the "ls" command in Linux).

→If any directories exist in TMPDIR/pass/component/, the names are considered as element names. An element is added in the XML for each directory name. These directories can have further levels of nesting and directories at all levels can contain .xml files.

→ The .xml filenames should preferably match the element name whose XML they contain. In case an element has nested elements, then care should be taken to ensure that one Plan Script does not overwrite the XML file or other files created by another Plan Script.

→ "HPE - Windows - Unattend - Save" will recursively traverse this directory structure to generate Unattend.xml.

→If "HPE - Windows - Unattend - Debug" script is added, the final generated XML is logged in the deployment log, which can be used for debugging. It also checks the XML for valid XML syntax.

SetupComplete.cmd conventions

→Scripts created in /ISdeploy/SetupComplete/ directory are executed by SetupComplete.cmd in alphabetical order (same as order of files listed by "ls" UNIX/Linux command without any options).

→SetupComplete.cmd with commands to execute scripts in the above directory is generated by the unmount Plan Script.

→A reboot script for Windows is also executed at the end of SetupComplete.cmd which restarts Windows if an empty file exists at "S:\ISdeploy\Restart-required" (/ISdeploy/Restart-required" in Guestfish)

Creating new OS Build Plans

If a fresh new OS Build Plan is created, the type and the settings (constraints) for the custom attributes must be properly assigned for the HPE-provided Plan Scripts. The HPE-provided OS Build Plans can be used as reference for

Note
While Plan Scripts are added to the Build Plan, we will always need to maintain the order in which the operations should be performed. Here, operations will be performed in the below order. 1. Mount Script 2. Personalize Script 3. Unmount Script

In case the order is not correct, please correct using below procedure:
Click on the arrow symbol  and drag the Plan Script to desired step.

OS Build Plan, Server Profile and Deploying the Image

Login to HPE OneView and access HPE Synergy Image Streamer UI from OSDS page.
Click OS Build Plan from HPE Synergy Image Streamer main menu.

Select the Build Plan “HPE - Windows - Deploy - HA” in the left pane and click “Action”. Execute the “Copy” action on the Build Plan.

Enter a name of “OS Build Plan – TeamX” where X is your team name. Select “HPE-Windows-HA – Network Configuration” hit “x” to remove the Plan Script. Once removed, Click Add steps and select the “HPE-Windows-Network - Planscript” script. Click “Add”

Note

While we add the Plan Script to the Build Plan we will always need to maintain the order in which the operations should be performed. Therefore we will need to move the new Plan Script to the 6rd step as below.

In case the order is not correct, please correct using below procedure:

Click on the arrow symbol  and drag the Plan Script to desired step. Click **OK**.

Upload Golden Image

Golden Image: A Golden Image of the Operating System to be deployed. When added to the HPE Synergy Image Streamer Appliance, a corresponding Golden Volume is created. Golden Image and Golden Volumes are replicated across all the appliances.

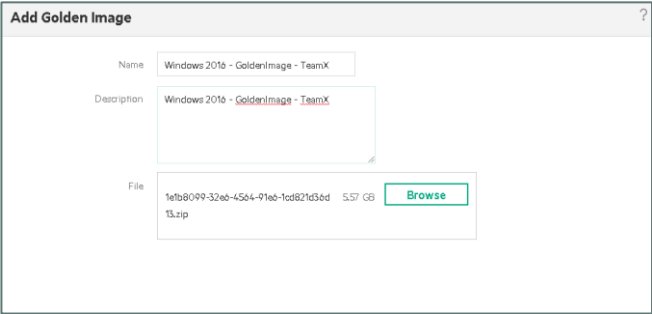

Note
Creation of Golden Image will be the Customer's responsibility. HPE will not provide any Golden Image to customers due to licensing issues, however the Golden Image creation procedure will be shared with the customer.

Login to HPE OneView and access the HPE Synergy Image Streamer UI from OS Deployment Server page.
Click Golden Images from the HPE Synergy Image Streamer main menu.

Click Add Golden Image
Type a name of “Windows 2016. Add a suitable description.

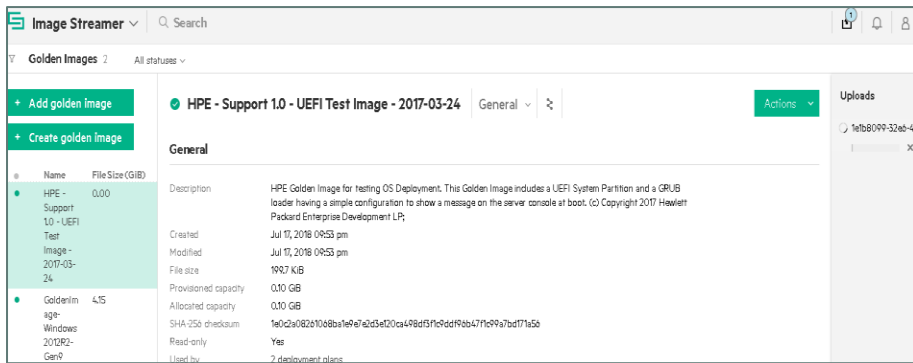

Browse the Golden Images from your local file system and click “Add” for “**Golden-Images\1e1b8099-32e6-4564-91e6-1cd821d36d13ESXi 6.0 20161110.zip**”

© Copyright 2018 Hewlett Packard Enterprise Development LP. The information contained herein is subject to change without notice. The only warranties for Hewlett Packard Enterprise products and services are set forth in the express warranty statements accompanying such products and services. Nothing herein should be construed as constituting an additional warranty. Hewlett Packard Enterprise shall not be liable for technical or editorial errors or omissions contained herein.

This document contains confidential and/or legally privileged information. It is intended for Hewlett Packard Enterprise and Channel Partner Internal Use only. If you are not an intended recipient as identified on the front cover of this document, you are strictly prohibited from reviewing, redistributing, disseminating, or in any other way using or relying on the contents of this document.

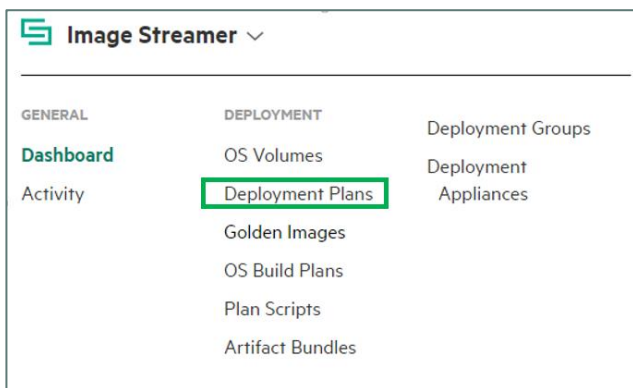

Upload progress can be monitored from the GUI.

Once uploaded, the Golden Image will show up in the GUI (under Golden Images section).

Create Deployment Plan

Login to HPE OneView using your Administrator credentials, and access the HPE Synergy Image Streamer UI from the OS Deployment Servers page.

Click Deployment Plans from the HPE Synergy Image Streamer main menu

Click Create Deployment Plan and Enter Below:

Name : Deploy Windows 2016

Description : Deploys Windows 2016 onto Synergy Compute nodes.

Choose OS Build Plan from the drop down list.

Choose the Golden Image “Windows 2016 Golden Image name.

Edit the “DomainName” in Plan Attributes to a value of “demolab.net”

Note

Compute Modules need to be turned off before a server profile is applied. There is a constant sync between the HPE Synergy Image Streamer and HPE OneView for the Deployment Plan. The Deployment Plan once created on HPE Synergy Image Streamer will show up under the OS Deployment section in Server profile of HPE OneView.

With the selection of the Deployment Plan, the Custom attributes derived from Plan Scripts would appear.
Enter Custom Attribute values.

Sep 2018

Server Profile creation should create the boot volume on HPE Synergy Image Streamer appliance, install the operating system and perform customization as derived from Deployment Plan.

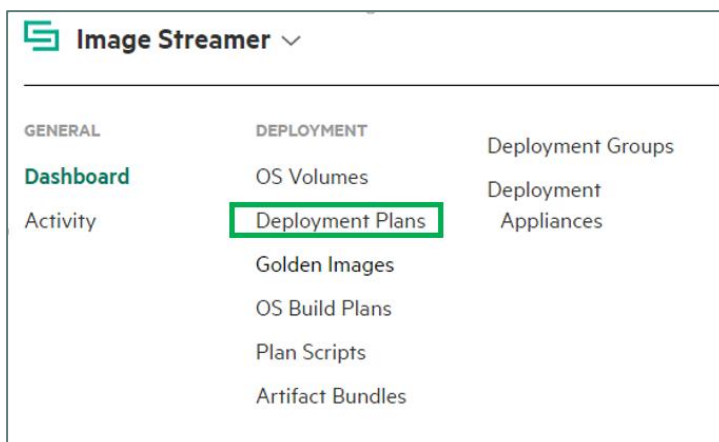

Capture Functionality

The capture functionality of the HPE Synergy image streamer appliance enables you to capture an existing instance of an operating system on the compute module. The HPE Synergy Image Streamer resource management interface removes all server specific information before creating a Golden Image from the installed operating system. The process is called generalization. Capture can be run only on an HPE Synergy Image Streamer hosted OS volume.

For a new setup, to create the capture, you can create an empty OS volume, Assign it to the compute module, boot the server, install the OS manually, and install any additional drivers and then run the capture to create the Golden Image that can be used for subsequent OS deployment operations.

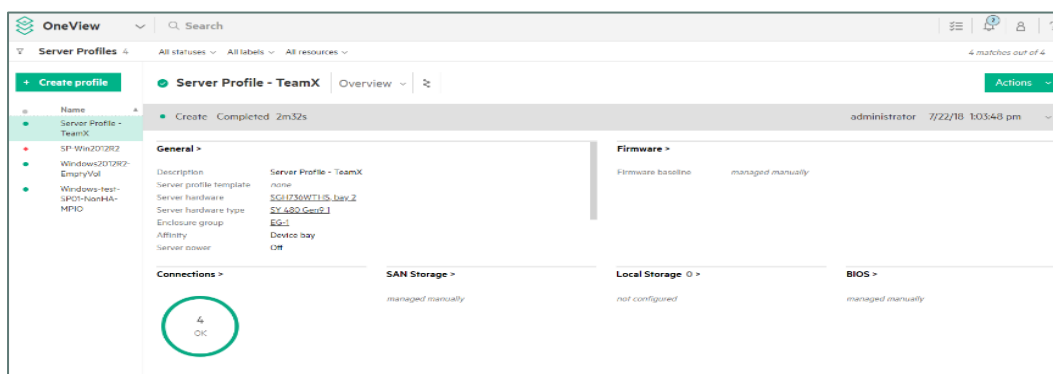

Create Empty OS volume on HPE Synergy Image Streamer Appliance

Click Deployment Plans from HPE Synergy Image Streamer main menu.

Click “Create Deployment Plan” and enter the following details:

Name : Empty OS Volume Creation
Description : Empty OS Volume Creation DP

Deployment Settings

Setting	Value
VolumeSize	<div>40960</div> MiB

The Server Profile when created using the Deployment Plan - “Empty OS volume creation” will create the 40 GB volume and assign it to the selected host.

File System

The Windows image must contain a FAT32 partition which is assigned the drive-letter “S:” It is assumed that the FAT32 partition exists at dev/sda5 device path in guestfish. If the FAT32 partition is not on the mentioned device path, the “HPE - Windows - Mount” Plan Script has to be modified with the appropriate path. If the drive-letter assigned is different, all scripts with reference to paths on S: drive have to be modified.

Golden Image Capture

We assume that the users already have a running HPE Synergy Image Streamer setup.

- Ensure that you have access to Windows 2016 R2 ISO file.
- Create a Server Profile with “HPE - Foundation 1.0 - create empty OS Volume” as OS Deployment Plan and a server hardware of desired hardware type (see below section on Golden Image Compatibility below). Set an appropriate value for volume size in MiB units, say 40960 MiB. Please refer to the above section Create Empty OS volume on HPE Synergy Image Streamer Appliance
- The HPE Synergy Server will be configured for access to this empty OS Volume.
- Launch iLO Integrated Remote Console of this server and set the Windows 2016 R2 ISO file as virtual CD-ROM/DVD image file. Power on the server.

One-Time Boot Status

Current One-Time Boot Option:

CD/DVD Drive

Sep 2018

- (Optional) To take a backup of this installation at this stage:
 - a. Shutdown the server.
 - b. Perform an as-is capture using "HPE - Windows - Capture - As-Is" Build Plan to create the "as-is" golden image of the OS.
 - c. Deploy another server with the Golden Image captured in previous step and boot the server.
- Install any additional software or roles if required.
- Create a FAT32 partition which will be used by the artifacts for personalization:
 - a. Open "Computer Management" > "Disk Management"
 - b. Select C: partition
 - c. Shrink volume.
 - d. Change amount of space to shrink to 100 MB.
 - e. Select Shrink.
 - f. Select new unallocated space.
 - g. Select New Simple Volume
 - h. Leave size.
 - i. Assign drive letter, (Choose S)
 - j. Format as FAT32 file system type (this requires changing from the default)
 - k. Give Volume label as "ISDEPLOY"
 - l. Finish
 - m. "ISDEPLOY (S:)" should be shown

Sep 2018

- Backup drive-letters.

```
reg export HKLM\System\MountedDevices C:\driveletters.reg
```

- Generalize Windows using sysprep

Open Command Prompt window and run the following.

```
cd Windows\System32\Sysprep
Sysprep /generalize /oobe /quit
```

Warning

This operation is destructive and will remove all configuration. To take backup of the system at this stage, capture an as-is Golden Image.

This will take a few minutes to complete and will generalize the system. All settings will be lost. This does not remove any additional user accounts that are created. Any user accounts not required in the captured Golden Image must be manually deleted.

Sep 2018

- Restore drive-letters

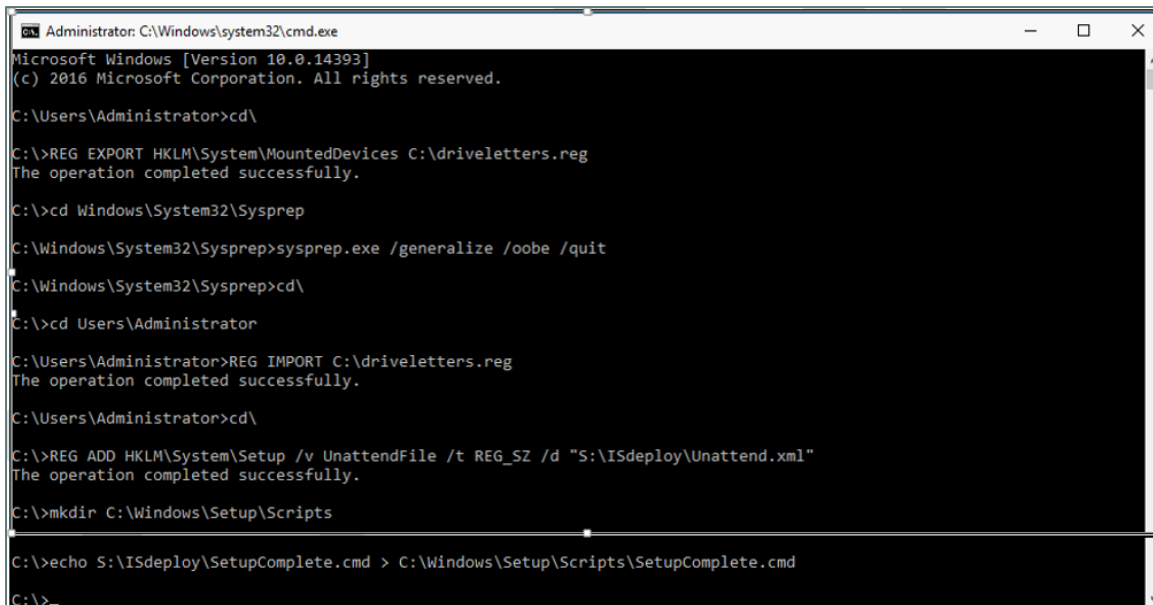

```
reg import C:\driveletters.reg
```

- Set Unattend.xml location to the FAT32 partition

```
reg add HKLM\System\Setup /v UnattendFile /t REG_SZ /d  
"S:\ISdeploy\Unattend.xml"
```

- Set SetupComplete.cmd location to the FAT32 partition

```
mkdir C:\Windows\Setup\Scripts  
echo S:\ISdeploy\SetupComplete.cmd >  
C:\Windows\Setup\Scripts\SetupComplete.cmd
```

```
Administrator: C:\Windows\system32\cmd.exe

Sep 2018

From your Server Profile deployment creating the Empty Volume make a note of the Volume number in HPE OneView as this will be needed. The example below shows it to be OSVolume-8

From HPE Synergy Image Streamer Menu, Click on “Golden Images”.

Click “Create Golden Image” and Enter Name, Description.

Sep 2018

Important

Choose the Golden Image you just created, and delete it. This is in order to make sure there is enough space for other teams for their lab to work correctly. Navigate to Golden Images, and on the Actions menu and press Remove.

Golden Image Compatibility

The golden image created using the above method will work only on server hardware of the same model (for example: HPE Synergy 480 Gen9) containing same number of processors.

If the server hardware is of different model or contains different number of processors, or if the boot controller is moved from one CNA/slot to another, Windows will be unable to boot on the deployed server hardware.

Pagefile Size

Following is recommended for the size and location of the pagefile:

If the pagefile is going to be of small size (< 1 GiB), then it can be located on the OS volume.

If the pagefile is going to be large (> 1 GiB), then it should be located on local disk or SAN and configured appropriately.

If a large pagefile size is required and the above recommendations cannot be followed, then using Windows with HPE Synergy Image Streamer may require reconsideration as having a large pagefile on the OS volume may consume significant storage on HPE Synergy Image Streamer and limit the number of server profiles that can be deployed.

Troubleshooting Techniques

- Debugging personalization done using setcomplete.cmd

C:\SETUP.LOG - it is a log file that has result of commands/scripts that runs through setupcomplete.cmd. All the components in HPE Synergy frames are running qualified firmware as per the GARFS/SERFS/TERFS recipe

- Debugging personalization done using unattend.xml

If booting up of server fails with error in parsing unattend.xml
